

Abd Allah Al Habbash

Java Backend Developer

Palestine | abdallahalhabbash@gmail.com | +972 56 716 2449 | github.com/HabbashX

PROFESSIONAL SUMMARY

Backend developer with 4+ years of hands-on experience in Java, focused on designing and building scalable REST APIs, backend systems, and developer tools. Experienced in Android application development using Java, with additional exposure to Kotlin across the JVM ecosystem and Rust for systems-level programming. Comfortable owning projects end to end: from designing custom frameworks and language tooling to building production-style backend services with clean architecture, secure authentication, and database-driven design. Currently pursuing a degree in Management Information Systems while building and shipping independent software projects.

TECHNICAL SKILLS

Languages: Java, Kotlin, Rust, Lua, SQL

Backend & Frameworks: Spring Boot, REST API design, JWT authentication, WebSockets, Maven, Apache

Mobile: Android (Java), WorkManager, background services, notification handling

Frontend & Web: HTMX, HTML, server-rendered UI patterns

Databases: MySQL, PostgreSQL, SQLite, Redis

Tools & Platforms: Docker, Git/GitHub, IntelliJ IDEA, Linux, Postman/Swagger

Concepts: Clean architecture, HMAC-signed webhooks, bytecode manipulation, reflection-based frameworks, compiler/interpreter design

PROJECT EXPERIENCE

Larv Programming Language — Independent Project

2023 – Present

Custom JVM-targeting programming language and toolchain

- Designed and implemented a full language pipeline in Java: Lexer, Parser, AST, and an Interpreter/Compiler targeting JVM bytecode.
- Built a Java FFI (foreign function interface) system enabling Larv code to call Java classes and methods directly via reflection.
- Authored 13 standard library modules (json, io, http, jdbc, math, and more) with explicit-arity parameter signatures.
- Diagnosed and fixed a bytecode generation defect where accessor methods incorrectly compiled to reflective calls instead of direct JVM instructions, improving runtime performance.
- Developed an accompanying IntelliJ IDEA plugin with syntax highlighting, real-time error checking, code completion, and a project creation wizard.

AxiomHttp — Independent Project

2023 – Present

Annotation-driven HTTP client framework for Java

- Built a declarative HTTP client library using ByteBuddy runtime proxies, allowing developers to define API clients via annotated interfaces.
- Implemented a pluggable interceptor pipeline for request/response processing, plus Jackson-based serialization.
- Authored full developer documentation, including inline Javadoc and a formal reference document.

Property-Parser — Independent Project

2023 – Present

Lightweight Java library for property file parsing and resolution

- Designed a parsing library for reading and resolving structured property/configuration files in Java applications.

GazaPay — Independent Project (In Progress)

2024 – Present

Fintech payment notification platform

- Currently developing a Spring Boot and Android-based platform; implementation details are confidential while the project is in active development.

EDUCATION

Bachelor of Science, Management Information Systems

In Progress (2nd Year)

University of Palestine

ADDITIONAL INFORMATION

- Active open-source contributor and project author — GitHub: github.com/HabbashX
- Public repositories include: Larv-Language, AxiomHttp, Property-Parser, TCPServer, E-Commerce-System, LuaInjector, DragonAutomation
